- 16. (Currently Amended) A pouch battery emorphising an electrode assembly, said assembly formed by respectively overlaving a sheet cathode, a sheet separator and a double-sided sheet anosto to form a snacked structure, and subjecting the stacked structure to multiple fields, wherein the initial fulli commisses fullting the esthode in half around the double-sided amode so as to surround the respective apper and lower active made surfaces thereof, and

wherein one or more subsequent folds is made with the fold time extending perpendicular to the original length of the stacked structure and its overall length is halved at each fold,

in which the double-sided agode comprises a single sheet current collector and one or more anothernal layers forming said upper and lower active surfaces.

wherein said layers have been ettached together or morged together or otherwise combined logether to form a single integral anodesecording to claim 15-, and

in which the double-sided anode comprises a current collector in the form of a mosh or grid with lithium foil occupying the openings thereof to form a double-sided lithium anode.

double-sided sheet anode to form a stacked structure, and subjecting the stacked structure to multiple folds, wherein the initial fold comprises folding the cathode in half around the double-sided anode so us to surround the respective upper and lower active anode surfaces thereof, and wherein one or more successive folds comprises folding the stacked structure so its overall length is halved with each fold, the fold lines being made perpendicular to that length, and wherein the double-sided anode comprises a current collector in the form of a mesh or grid with hithium foil occupying the openings thereof to form a double-sided lithium anode.
